# Android Management setup

To manage Android devices with Cerberus Enterprise, you must first connect your organization to Google Android Enterprise.

> The setup process usually takes a few minutes and requires a **work email address** (for example, *name@enterprise.com*) or, alternatively, a **personal Google email address**.

# What happens during setup

- You will be redirected to Google Android Enterprise.
- You sign in with your work email address (or a personal Google email address).
- Google creates the Android Management account for your organization.
- You are redirected back to Cerberus Enterprise to complete the setup.

# Important information

We recommend signing up with a work email address, not a personal Gmail account. If the email address is already associated with a Google Admin account, that existing account is reused and bound to Cerberus Enterprise; otherwise, a new free Google Admin account is created. A Google Admin account unlocks the full set of features — for example, enrolling devices using Google authentication with accounts managed by your Google Admin domain.

# Don't have a work email address?

You can still sign up with a personal Google email address (for example, a Gmail account). In this case, Google creates a free managed Google Play account that is bound to Cerberus Enterprise.

# Next steps

After completing the setup, create an **Enrollment token** and choose the appropriate provisioning method for the device.
